

OWOOLUWA SAMSON OLABANJI

Full-Stack & Application Engineer

I build real products and application systems — from interfaces and backend services to realtime communication, automation, AI agents and cross-platform experiences.

THE ENGINEER I AM NOW

My work has moved beyond building pages. I build applications, automation systems and reusable product capabilities that can solve a specific business problem and be integrated into an existing product.

My strongest advantage: I can take a problem, understand the product around it, build the feature or system, and make it usable — without needing to rebuild everything from scratch.

WHAT I SOLVE

Problem	Solution I provide
A website needs a new capability without a full rebuild.	Plugin-and-play features: modular components/services designed to integrate into an existing site or product.
Teams need automation beyond simple forms and dashboards.	Agents and workflow automation that connect APIs, tools and actions into practical workflows.
Users need to interact with products through familiar channels.	Conversational and messaging experiences, including WhatsApp-agent workflows.
Creative teams need motion without rebuilding everything manually.	Web-based motion design tooling and programmatic video/motion workflows using Remotion.
Products need intelligent assistance.	Agent-based application experiences such as Samix Agent, with modular tools and extensible capabilities.

SELECTED RECENT WORK

Samix Agent

AI Agent / Application Architecture

An agent-focused system built around extensibility rather than a single fixed capability. The direction is a modular tool/plugin architecture so capabilities can be added without rewriting the core.

Engineering: Agent architecture · tools · plugins · automation · extensibility

WhatsApp Agent

Conversational Automation

A practical agent experience focused on bringing automation into a channel people already use. Built with Tuari Dev and Rust as part of exploring more capable, system-level application development.

Engineering: Tuari Dev · Rust · agents · messaging · automation

Web Motion Design App

Creative Engineering / Web Application

A motion design application that runs on the web, combining application engineering with the user's background in motion design. The project demonstrates the ability to turn a creative workflow into a usable software product.

Engineering: Web application · motion design · creative tooling

Remotion Design

Programmatic Motion / Video

Exploring Remotion as an engineering tool for creating dynamic motion and video experiences programmatically — connecting design, code and automation.

Engineering: Remotion · React · motion · programmatic video

SkoolConnectNG

Social Education Platform

A real-world student networking platform connecting Nigerian students, aspirants and alumni. The application spans authentication, profiles, communities, resources, messaging, notifications and realtime experiences.

Engineering: Next.js · TypeScript · Supabase · PostgreSQL · realtime · Vercel

Thrive Africa

Full-Stack Product Development

Worked across frontend and backend development on an education-focused product, integrating APIs and building application functionality with React, Node.js and MongoDB.

Engineering: React · Node.js · MongoDB · APIs

THE DIFFERENCE: PLUG-IN, NOT REBUILD

One of the product capabilities I care most about is building features that can be plugged into an existing website or application. A company should not have to throw away its current system to add something valuable.

I approach these features as modular product capabilities: define the interface, isolate the functionality, expose the required APIs or integration points, handle authentication and data flow, then make the feature easy for another product to consume.

Think: build once → integrate where needed → keep the host product intact.

ENGINEERING TOOLBOX

Application	React · Next.js · TypeScript · JavaScript · PWA · cross-platform
Backend	Node.js · REST APIs · Supabase · PostgreSQL · MongoDB
Realtime	Realtime messaging · notifications · event-driven application flows
AI / Agents	Agent systems · tool/plugin architecture · automation · LLM application exploration
Systems	Rust · API integration · modular services
Creative Technology	Remotion · GSAP · Framer Motion · SVG · Web-based motion tooling
Cloud / Delivery	Vercel · AWS · Git · deployment workflows

HOW I THINK

I don't want to be limited by the language or framework I already know. My frontend foundation taught me product experience; backend work taught me systems; agents and Rust are pushing me deeper into architecture and execution.

That is also why I'm comfortable exploring Java, Spring Boot and reactive architecture. The syntax is new territory; the engineering problems — APIs, asynchronous workflows, data flow, modularity, performance and scalable application design — are familiar.

WHAT I BRING TO A TEAM

- **Product thinking:** I care about what the feature actually solves, not just whether it works.
- **Full-stack range:** I can move between interface, API, data, integration and deployment.
- **Fast learning:** I actively explore unfamiliar technologies when the problem demands them.
- **Integration mindset:** I can build capabilities intended to plug into an existing product instead of forcing a rewrite.
- **Creative + technical:** I understand both software engineering and visual/motion experiences.

LET'S BUILD SOMETHING THAT FITS THE PRODUCT — NOT JUST THE TECHNOLOGY.

Open to application engineering, full-stack development, backend systems, agentic applications and opportunities that require learning a new stack quickly.
